

Scope and ownership

The resilience handbook covers the tier-one authentication and checkout services. The Reliability lead owns recovery coordination, while the Commerce lead validates checkout integrity before traffic returns.

Recovery objectives

Tier-one services have a recovery time objective of forty-five minutes and a recovery point objective of ten minutes. Both objectives are measured from the declared incident start time.

Failover sequence

The incident commander must freeze writes, promote the verified replica, and then rotate service endpoints. Two approvers - Reliability and the affected product lead - must confirm the promotion before traffic is restored.

Exercise and evidence

A recovery exercise runs every quarter. Evidence must be archived within thirty days of the exercise, and corrective actions must be assigned within ten business days.
